

A census of genera and subgenera of free-living nematodes described ensuing Andrásy's book, 1976

By
I. ANDRÁSSY*

In my book on the systematization of nematodes (1976) I registered the genera and subgenera of free-living Nematoda, and stated that 1410 generic taxa had been described up to that time. In the subsequent years I twice published (1981, 1985) some additional lists of the newly established genera, and enumerated in total 249 taxa. But since then further genera and subgenera, one after the other, have been proposed as new to science so that the great quantity of them has become hard to handle. I feel therefore it is time to give a summary of these taxa.

In the present catalogue I summarise all the genera and subgenera of free-living nematodes which have been published since the book mentioned above as well as a few older ones which were not included in that publication. The names of the genera and subgenera are enumerated in alphabetic order, and at each taxon the corresponding systematic order (Monhysterida = MO, Desmoscolecida = DE, Araeolaimida = AR, Chromadorida = CH, Rhabditida = RH, Tylenchida = TY, Enoplida = EN, Dorylaimida = DO) and family are added.

The list contains 443 genera and subgenera, respectively. Subclass Torquentia is represented by 86 (20%), Secernentia by 166 (37%) and Penetrantia by 191 (43%) taxa. They are distributed among the different orders as follows: Monhysterida 16, Desmoscolecida 12, Araeolaimida 21, Chromadorida 37, Rhabditida 38, Tylenchida 128, Enoplida 40 and Dorylaimida 151 taxa. From the 443 genera/subgenera 92 (21%) contains marine and 351 (79%) continental species. Not important but it may be mentioned that the major quantity of these taxa has been described by three authors: SIDDIQI (61), JAIRAJPURI (57) and ANDRÁSSY (47 taxa).

The total sum of generic taxa of free-living (not animal parasitic) nematodes is: $1410+443=1853$ — close to two thousand.
